Team ID	23A51A05M8
Project Name	Metro Ticket Generating System in ServiceNow
Maximum Marks	4 Marks

Solution Architecture:

The Metro Ticket Booking System is built on the ServiceNow platform using a layered architecture approach. Users interact with the system through a Service Catalog item that captures journey details such as source station, destination station, journey date, and passenger count. The application logic layer processes the request, retrieves fare information from the metro fare database, and automatically calculates the total ticket cost using Client Scripts, GlideAjax, and Script Includes.

- **User Interaction Layer:** Service Catalog provides a self-service interface where users can select source and destination stations, journey date, and passenger count to book metro tickets.
- **Business Logic Layer:** Catalog Client Scripts, GlideAjax, and Script Includes work together to validate inputs, retrieve fare information, and automatically calculate ticket fares.
- **Data & Service Layer:** ServiceNow tables store station, fare, and ticket information, while Notifications, QR code generation, and Dashboards provide ticket delivery, communication, and analytics capabilities.
